

Basic Objectives for Ambient Air Monitoring Networks

- Determine **highest concentrations** expected to occur in the area covered by the network.
- Determine representative concentrations in areas of **high population** density.
- Determine the impact on ambient pollution levels of **significant sources** or source categories.
- Determine general **background concentration** levels.
- Determine the extent of **regional pollutant transport** among populated areas and in support of secondary standards.
- Determine the **welfare-related impacts** in more rural and remote areas (such as visibility impairment and effects on vegetation).
